Introduction

This poster describes the novel mid-infrared quantum cascade laser (QCL) based trace gas sensor technology using both QEPAS and traditional PAS. Two current sensor applications are reported: 1] a 10.34 μ m CW TEC DFB QCL based QEPAS sensor that is used to quantify NH₃ in exhaled human breath and 2] a 10.3 μ m broadly tunable CW TEC EC-QCL based PAS sensor that monitors NH₃ in Houston, TX, an urban environment

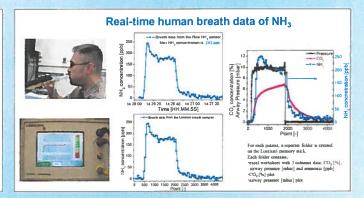

Future Directions of trace gas applications

- Improvements of existing sensing technologies using state-of-the-art QCLs and ICLs
 Further development of spectrophone technology based on one fabrication techniques
- · Ultra-commact, low cost, robust trace gas sensors
- Development of laser based gas sensor networks based on QEPAS and LAS
 New applications enabled by novel tunable EC-QCLs (i.e. sensitive concentration measurements of HCs, UF, and multiple species detection)
